Prepare both a summary paragraph and a general description of the resource and its various elements as it exists today.

This hexagonal screw-pile cottage lighthouse is located on the edge of Back Creek, visible from Solomons Island Road. The cottage section of the lighthouse is framed and weather-boarded with an unroofed gallery encircling the lower story. The first story is divided into four equal-sized rooms. There are two rooms on the upper story.

Prepare both a summary paragraph of significance and a general statement of history and support.

This structure originally marked the north side of the entrance to the Patuxent River near Solomons Island. When it was built, it stood out in about 10 feet of water far enough out so that ships could sail between it and the shore. By the time it was decommissioned in 1962, it was seated on dry land at low tide. It is one of three screw-pile cottage-type lights remaining on the Chesapeake Bay. Between 1854 and 1908, 42 examples of this sort of lighthouse were built on the Chesapeake Bay.

The Drum Point Lighthouse was operated by the U.S. Lighthouse Service until 1939, when the Coast Guard took over. In 1962, the lighthouse was replaced by an automatic beacon light. The slowly deteriorating abandoned structure was listed on the National Register in 1973. The lighthouse was moved to the Calvert Marine Museum in 1975.

See: National Register nomination.

A History of Drum Point Lighthouse published by the Calvert Marine Museum, 1978.

DESCRIBE THE PRESENT AND ORIGINAL (IF KNOWN) PHYSICAL APPEARANCE

Few historic buildings in Calvert County are as well documented as the Drum Point Lighthouse. Being as a project of the U.S. government there are many documents relating to it including original floor plans, color specifications, materials etc. Copies of all these materials are on file in the Calvert Marine Museum, Solomons, Maryland and partial copies are attached to this report. Most of the originals are in the National Archives.

The advantage of a screw pile is that it offers the least amount of resistance to water waves and the wind. Given this base a polygon lends itself nicely to that which is being supported.

In looking at the plans of the lighthouse one immediately calls to mind the work of Orson Fowler the great Mid-nineteenth Century proponent of the architectural designing. That the lighthouse was to be a residence as well as navigational marker, provided the architect with certain unique problems. Lighthouses have traditionally been cylindrical, however, there is no real reason why the residence beneath it could not have been another shape than an octagon. It is admitted by Fowler and others that the circle is a "perfect" form; the lack of corners, bracing, etc., lends itself to many specialized uses with ease. It is a shape which does not lend itself easily to some materials, however, particularly wood. As pointed out by Fowler, the circle is most closely reached by a polygon. An octagon has more obtuse angles than do pentagons or hexagons and seems to have been quite popular.

Orson Fowler was not the first to build an octagon as is evidenced by the fact that he first published in 1849 and the first screw pile lighthouse in the U.S. was an octagon built in the Delaware Bay in 1848. Fowler's work may or may not have influenced the design of the Drum Point Lighthouse but one must admit the striking similarities seen in the floor plans of the lighthouse and the "J.J. Brown Residence" c. 1853. Fowler probably would not have separated the two first-floor bedrooms of the lighthouse with a portion which bisects the angle formed by walls E and F but the other rooms are quite alike. Inner walls form 90 degree angles and attempt to meet the outer walls at 90 degree angles. The lighthouse does not take full advantage of Fowler's observation that acute angles result in difficult to clear corners but the openness achieved by the seemingly long outer walls and the conciseness of a centralized plan do create a more desirable living space for what was necessarily confined existence.

On the first level of the lighthouse were two bedrooms, a kitchen, and a sitting room. The rooms were nearly of equal size although the kitchen and sitting room were made slightly smaller by a utility well in between them. This well included the stairs, a pantry and a coal room. There were two more bedrooms on the second floor each having a large dormer and closets. The dormer on the east side gave access to the large bell. The ballustraded hexagonal lantern frame crowns the polygonal hipped roof.

STATEMENT OF SIGNIFICANCE

Like its neighbor at Cove Point, the lighthouse which was on Drum Point has been photographed and written about many times. All sources agree that it is one of the few screwpile lighthouses still in existence and that lighthouses themselves are an endangered species. It was for this reason that after the Drum Point Lighthouse had fallen into disuse it was moved to the nearby Calvert Marine Museum where it is being restored and used as a tourist attraction.

DESCRIBE THE PRESENT AND ORIGINAL (IF KNOWN) PHYSICAL APPEARANCE

The Drum Point Lighthouse was located at the southern end of Drum Point, Calvert County, Maryland at the mouth of the Patuxent River. The Light is now at the Calvert Marine Museum on the western bank of Back Creek on the east side of Maryland, Route 2, north of Solomons Island.

The hexagonal wooden structure is held up by iron supports of the screw-pile type. An auger-like flange was bored into the soft Patuxent River bottom forming the support for the columnar iron base from which the weight of the entire lighthouse, which is fastened to the column, is diffused.

Chesapeake Bay screw-pile lighthouse construction is typically hexagonal or square.

The Keeper's quarters, six-sided and sheathed with weatherboards, is solidly built with mortised and tenoned joints, a hexagonal roof and two dormer windows. An unroofed open gallery encircles the lower story of the structure. On the top of the house is the cupola containing the lighthouse lamp.

A small, second open gallery surrounds the cupola. The original light, described as a "fixed red" on an 1877 chart, was replaced with an automatic light after World War II. The original light from the Drum Point Lighthouse is on exhibit at the Chesapeake Bay Maritime Museum, St. Michaels, Maryland.

Originally placed one-sixteenth of a nautical mile from shore, the water around the lighthouse gradually receded until, from 1965 on, the lighthouse had become marooned on the beach. The present site gives the Lighthouse a much more appropriate setting at the edge of the water.

Drum Point Lighthouse had been a matter of concern to preservationists for several years. The only way to preserve it and to secure its future was to move it. A memorandum of agreement between the Advisory Council on Historic Preservation, the General Services Administration and the Maryland State Historic Preservation Officer (June 1973) endorsed the move.¹ The Memorandum of Agreement contains a copy of the positive easement attached to the deed of sale which further protects the lighthouse. The General Services Administration disposed of the Lighthouse after the State of Maryland had been unsuccessful in maintaining the property. The lighthouse was legally inaccessible from the land. After April 1973, when the property was nominated to the Register (and while in Federal ownership), vandals got through fins in the structure. All twenty-two doors and twelve windows were broken, guard rails were damaged and the interior was defaced. Now, on its new site, the lighthouse will undergo restoration and will be accessible to the public. Private donations made possible the painting of the exterior.

¹Memorandum of Agreement, June 1973, with copy of easement and language, can be found in the files of the Maryland Historical Trust, Annapolis, Maryland.

STATEMENT OF SIGNIFICANCE

The Drum Point Lighthouse is one of the four remaining screw-pile lighthouses on the Chesapeake Bay.

Any lighthouse, and particularly a historic structure, is fast disappearing as navigational equipment due to the modern communications channels and satellite-related aids.

The Drum Point Lighthouse and other screw-pile lighthouses flourished on the Chesapeake Bay from the second half of the nineteenth century to the mid-twentieth century. They served as important navigational aids. Although the Drum Point Lighthouse has escaped demolition, its original light, which required a resident attendant, was replaced with an automatic light after World War II.

The first screw-pile lighthouse on the Chesapeake Bay was erected in 1855 in Virginia waters. In the mid-nineteenth century these practical lighthouses began to replace light ships, which were the principal navigation aids, on the Bay.

The United States Lighthouse Board, a branch of the United States Treasury Department, built the Drum Point Lighthouse on five acres in the mouth of the Patuxent River. The State of Maryland conveyed the property on which the lighthouse (only) stands to the Federal government on February 15, 1883. This transaction followed the provisions of an 1874 Maryland law that provides for the transfer of State property to become Federal property of the United States for the purpose of the erecting of lighthouses and other navigational aids.

Alexander Mitchell (1780-1868) invented the screw-pile principle. His idea was first used in 1838 at the Malpin Sand Lighthouse at the mouth of the River Thames, England. The principle was later applied to bridges, viaducts and piers. The screw-pile principle is well suited to southern bodies of water and to soft bottoms.
